

Here's the full idea in one place — nothing missed.

The Problem

- SMB owners running 2–3 online stores + a physical warehouse have no single view of stock — they check each channel separately
- Price creep from suppliers goes unnoticed until it's already cost money — no one tracks purchase price changes item-by-item
- Owners don't want another dashboard to log into daily — they live in WhatsApp, not apps

ICP (Target Customer)

- Small-to-medium business owners in Pakistan running multiple sales channels (2+ online stores, or online + physical warehouse)
- Owners who currently track stock manually or across disconnected spreadsheets/apps
- Business owners who have 1–3 staff under them needing some access to stock data
- Price-sensitive — can't afford global enterprise tools, but need more than a notebook

The Solution — "StockPulse"

- One dashboard pulling stock/sales data from every store + warehouse into a single view
- Daily automatic report sent straight to WhatsApp — no login required to check status
- AI flags purchase-price anomalies the moment a new price is entered (e.g. supplier raised cost 15%)
- Two-way WhatsApp Q&A — owner can text "biscuits ka stock kitna hai?" and get an instant answer
- Role-based access tied to WhatsApp number — owner adds staff by phone number, sets permissions, no separate logins

Why This Approach (the actual differentiation)

- WhatsApp-native, not just WhatsApp-notified — most competitors only push reports, we let owners interact
- Proactive, not reactive — price alerts trigger instantly, not "check this report and notice it yourself"

- Built for Pakistan specifically — PKR pricing, Urdu/Roman Urdu support, JazzCash/Easypaisa — not a USD tool translated after the fact

What's Already in the Market (and why it falls short)

- **Zoho Inventory, Extensiv/Brightpearl** — solid multi-channel dashboards, but global/enterprise-priced (~\$20–300+/month, i.e. roughly PKR 5,600–84,000/month), English-only, not WhatsApp-native
- **Vyapar, Syncli** — WhatsApp-integrated, but built around India's GST/UPI ecosystem, not Pakistan's
- **Gap:** nobody combines WhatsApp-first interaction + proactive AI price alerts + Pakistan-specific setup in one product — that's the open lane

How We'll Build It (phased, not all at once)

- **Phase 1 (MVP):** manual stock/price entry for one store/warehouse, daily WhatsApp report, price-anomaly alerts, basic WhatsApp query — test with 5–10 real shop owners
- **Phase 2:** multi-channel API integrations (actual online store syncing), staff role hierarchy, voice-note stock entry
- **Phase 3:** supplier comparison, shrinkage/mismatch detection, full automation

Estimated Cost to the Customer

- We haven't locked this yet — but positioning-wise, it should sit well below the global tools (which run PKR 5,600+/month) to win on price as well as fit
- A realistic target range to validate with real shop owners: **roughly PKR 1,500–4,000/month**, possibly tiered by number of stores/staff — this needs testing with actual owners, not just guessing

Still Open / Needs Your Input Next

- Real pricing validated with actual shop owners, not assumed
- WhatsApp Business API costs at scale need budgeting once past pilot users
- Which 5–10 real business owners you'll test this with, and when

Want to start today with drafting the outreach message to those first 5–10 shop owners, or go deeper on the pricing model first?
